Presented by: Jeremy Mitaux & Jennifer Barnett

Aster, \$ASTER

Executive Summary

Pitch Executive Summary
10/14/2025

Pitch Summary

Rating	Fairly Valued
Current Price	\$1.43
Price Target	\$5.00
Action Recommended	Buy
Recommended Size	3 ETH
Native Staking	Yes

Key Statistics

Network	Ethereum/Aster
Token Standard	ERC-20
Category	Defi
Sub-Category	Exchange, Perpetuals & Spot Trading
Circulating Market Cap (\$M)	\$1.697B
Fully Diluted Market Cap (\$M)	\$13.415B
52 Week Price Range	\$0.56-\$2.33
24-Hour Trading Volume	\$1.345B
TVL	\$2.437B
Last Week Protocol Fees	Est \$14.33M-\$34M ¹

Director of Investments:

Category Overview & Thesis

Perpetual decentralized exchanges (DEXs) represent the next evolution in on-chain trading, merging the capital efficiency and advanced features of centralized platforms with the transparency and self-custody of DeFi. The sector focuses on creating permissionless, composable markets that rival traditional derivatives in liquidity and speed—without sacrificing decentralization.

Project Overview

Aster (\$ASTER) is a DEX built for high-performance on-chain trading. Offerings include leveraged perpetual contracts, deep liquidity, and seamless user experience. It integrates risk management, cross-margin systems, airdrops, and incentive-driven liquidity provisioning to provide a robust decentralized trading ecosystem.

Project Thesis

We believe that the continued growth in perp volumes across as exchanges will be a driver of growth for Aster. The protocol believes future derivatives trading will be fully on-chain, with scalable perpetual protocols unlocking deep liquidity, fairness, and transparency, that rivals traditional futures positions exponentially. This concept is expected to position \$ASTER as a foundational player for decentralized financial markets.

Source: [Aster Price](#)

¹ \$14.33M was estimated fees collected on DeFi Llama, the week prior to \$ASTER delisting and \$34M is a collated figure across other DEXs where \$ASTER is found to be listed on. No direct data was provided by \$ASTER about fees collected, both before and after the misleading data was reported.

General Background

Figure 1: Token Price History

Source: [Aster Price, CoinGecko](#)

Figure 2: MCAP

Source: [Aster MCAP, CoinGecko](#)

Perpetual Decentralized Exchanges (Perp DEXs) are a decentralized platform for trading futures contracts that do not expire. Unlike traditional futures contracts that establish a final trade deadline, these futures can be settled, delivered, and traded, free of expiration. The downside of no expiration is that there is exponentially more room for loss and risk, however this also leads to room for even more returns.

This emerging space has demonstrated major market potential with just September 2025 demonstrating a 10x overall. All native tokens within the sector have jumped between 10%-300% just this month with Aster leading the pack in overall growth.

Standing out against competitors with multiple investing modes, high leverage options, added privacy features, and multi-chain capabilities, Aster offers the highest leverage percentage, 1001x in the industry. Found on BNB chain, Ethereum, Solana, and Arbitrum, users can trade across networks without any bridging necessary. The lessened workload while trading promotes a seamless trading experience with zero-friction. These capabilities combined with the Aster ecosystem that is designed for traders and earners to connect stands out to successfully leverage the exponential growth and expansion of the perp DEX space.

Macro Factors Impacting Protocol

When trading cryptocurrencies, every investor must decide where to do so. This has long been a major question for those new to blockchain, as the answer to this isn't straightforward. Traditionally, centralized exchanges have managed order books where buyers and sellers are matched. CEXs are popular because of their ease of use, especially for retail traders who benefit from not having to worry about wallets or liquidity. The UX is like creating a bank or investment account, and it is for this reason that centralized exchanges such as Coinbase or Binance, have remained central.

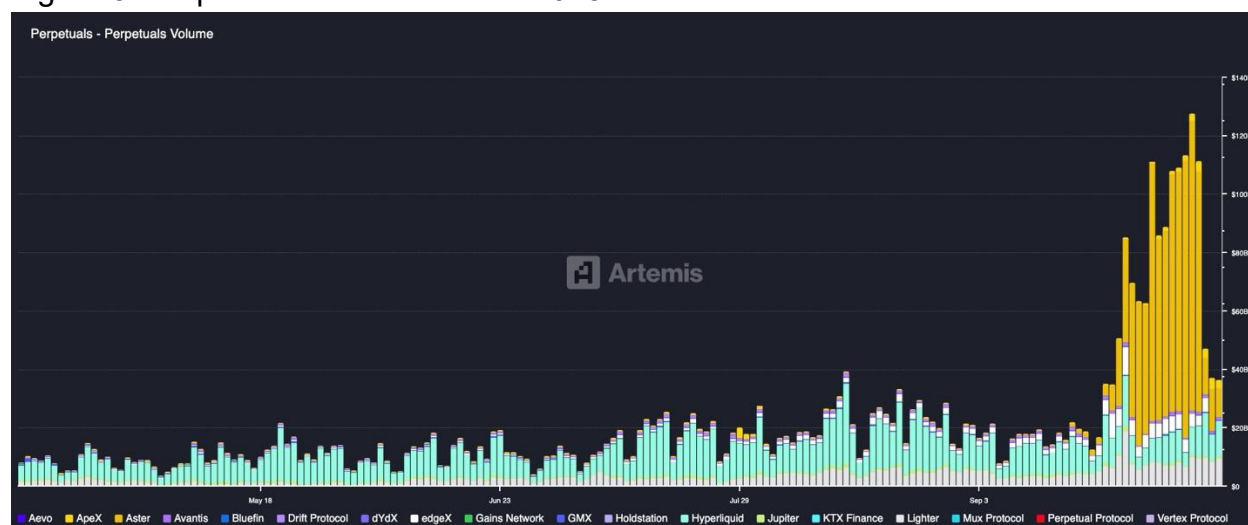

Aster is part of a growing group of decentralized perpetuals exchanges offering futures contracts with minimal hassle. DEXs fall under the broader category of decentralized finance, which has consistently been one of the most active spaces in blockchain. These exchanges provide an alternative to the traditional model of asset trading which involves intermediaries such as brokerages, exchanges, or banks. Users can simply connect a wallet of their choice and immediately begin trading. Money is kept on-chain making it easy for transferring funds on and off the exchange. Furthermore, there isn't any KYC or account information.

Although crypto perpetual futures have long been traded, decentralized exchanges have only recently gained attention with Hyperliquid entering the scene in late 2024. The project managed to tap into the desires of many traders, tying together liquidity, high-frequency trading, and a passionate community. A novel feature of Hyperliquid was introducing a purpose-built Layer-1 blockchain. The community responded enthusiastically, with Hyperliquid enjoying a growth rate of over 500% in 2025. Now with the attention, a host of imitators have entered, including Aster, hoping to share the spoils that Hyperliquid has uncovered.

	DEX	CEX
Trading	Peer to Peer	Centralized Intermediary
Private Keys / Asset Custody	Users have exclusive Control	Exchange Controlled
Liquidity	Potential low Liquidity	High Liquidity
UX	Knowledge Required	Easy to Use
Security & Regulations	No KYC or AML Standards	Highly Regulated

Figure 3: Perpetuals Volume Across 2025.

Note* Data for Aster in this graph is potentially manipulated

The Team and Company

Figure 4: Photos of Team Members

Formally known as Astherus and APX Finance, Aster was formed in 2024 via merger between the two companies. The strategic merger brought together over \$258B in perp DEX volume, integration of ZK-proofs, purpose-built L1, and intent-based architecture, a long-winded version to make the rebranded company a simple and easy to use protocol([BlockNews](#)).

Allegedly having employees from Binance, the team is expected to have real-world experience in managing DEX, unlike most DeFi projects. Additionally, Aster is backed by Yzi, a VC firm under Binance's founder Changpeng Zhao (CZ), who also publicly supports the project. Interestingly, aside from support from CZ, the founders remain anonymous besides the CEO known as Leonard, similar to Bitcoin's unknown CEO, Satoshi Nakamoto.

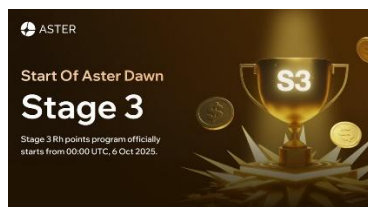

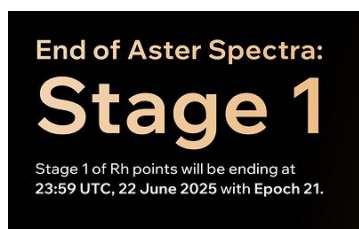

Most of the positive attention from established blockchain projects and VCs stem from belief behind the team, their connections, experience, and technical depth that enables the fast decision making needed. The team attracts trust, investors, and opportunities, even during wash trading rumors that should have tanked the token's price point more than the 13%

damage seen in the following 48-hours after the news broke.

All decisions made by the team are to reduce selling pressures while promoting long-term holding, some core stabilizing factors for the token and push it towards \$10 ([CaptainAltcoin](#)). Progress toward Aster Chain season 3 are underway, an update that will focus on faster trading, increased liquidity, and added privacy features to bring all the power of Web3 with a Web2 feel.

Roadmap

Figure 5: Aster Roadmap Stages

Aster's roadmap begins in 2024 after the merger between Astherus and APX, then it was a rush of efforts to progress towards the Aster known today. This stage was primarily targeting towards preparing for onboarding with their "Trade like a Pro, Earn like a Pro" program where people would trade on Aster Pro mode to earn points and qualify for the \$ASTER airdrops. The program broke down into

1. Au Points Program: incentivized holding and minting of specific assets (USDF, ALP, and specific LP tokens)
2. AU Trader Boost: enhanced Au earnings via trading perpetual contracts to meet a specified trading volume
3. Trade like a Pro, Earn like a Pro: continued trading for Rh and BONUSUSD points
4. Referral Bonuses and Team Boosts: expand rewards given through referral bonuses and team boosts

All actions for Stage 1 were to promote Aster Pro trading mode and the overall chain launch from Q4 2024. The official airdrops began in September of 2025, but the team began working on Spectra Stage 1 in April of 2025. This long-period of effort helped support a functional airdrop that allowed for the rapid success and takeover against main competitor, Hyperliquid, \$HYPE.

Following Aster Spectra Stage 1, currently Aster is in the Aster Genesis Stage 2 of the roadmap, another airdrop with specific targets in mind. This airdrop began on September 22, 2025 and will close on October 5, 2025. This period allows users to earn rewards until the closing deadline of the airdrop by participating in the following programs:

1. Trade Smarter & Earn Better: users continue using Rh points to be rewarded on both the quality and quantity of trades will be evaluated for rewards as well as hold length, added maker rewards, and realized profit/loss scores.
2. Referral and Team Points Score: Users now receive 10% from first level invites and 5% from second-level invites in base Rh points. Users

can now capture a percentage of rewards earned by their referrals, see ² below.

The second airdrop is designed to draw further attention via authentic engagement and active real trading beyond the timeframe of the airdrop. This airdrop was a flex version that incorporated feedback from stage 1 while making the process simpler for users, while promoting 1001x (simple) trading mode.

The future remains full of airdrops with Aster Dawn: Stage 3 beginning on October 10 and running until November 9, 2025. This airdrop introduces new enhancements that reward committed trading across Aster's two market types: Spot and Perpetual. Like stage 2, Dawn will build off of stages 1 and 2 to further increase volume, onboarding, and earn potential. Ways to earn in Stage 3 are³:

1. Rh points: users earn points for trading points scores, stemming from personal volumes
2. Select Spot and Perpetuals: holding and interacting with taker trades for double the points of maker trades
3. Perpetual Specific Opportunities: Added rewards for perpetuals holdings, with added value based on size and length of time held.

Altogether, the stages of each airdrop play into Aster's collective marketing strategy to undercut competitors such as Hyperliquid, Lighter, and other centralized exchanges (CEXs). The roadmap does not address other factors beyond the airdrops, and the consecutive nature since the original token launch leads for cause for concern and questions as to how Aster will survive this rapid growth and continue to derive value. The hype created by each airdrop will only go so far with the 53.3% allocation, so what will Aster do after these airdrops?

Specifics on What Protocol Does

Perpetual Mode (Pro)

Perpetuals trading using order book interface with deep liquidity, extremely low trading fees, and advanced trading tools

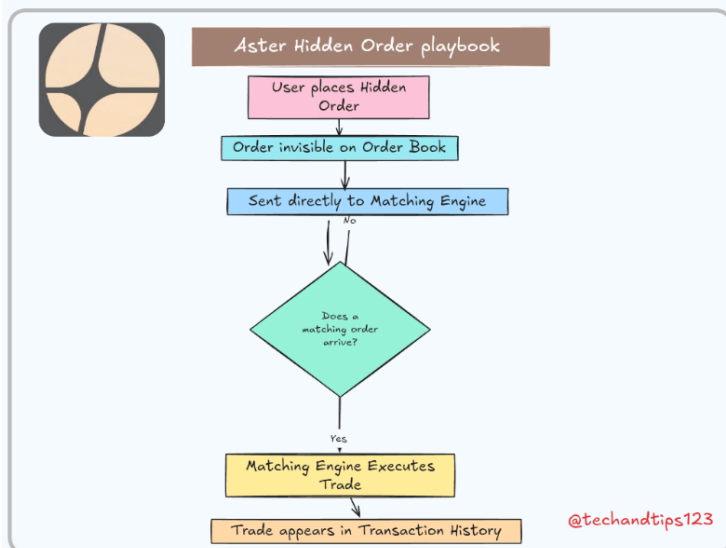

1001x

Perpetuals trading using on-chain liquidity, one click, MEV-resistant perpetual contracts trading

² User A invites users B, C, and D. If B invites user B2 and C invites user C2, user A earns 10% of users B and C points, and 5% if users B2 and C2 invites.

³ Scoring Methods: Final Points= Trading Points+ Position Points+ USDF/asBNB Points+ P/L Points * Team Boosts+ Referral Points (with referral point system described in footnote 1)

Spot Mode

Spot trading using order book interface with deep liquidity, extremely low trading fees and advanced trading tools.

Aster at its core is a decentralized exchange with perpetual and spot trading, while also offering an array of yield-generating products. With three trading modes, each with a specific audience in mind, Aster hopes to offer the most robust on-chain trading experience.

With Aster Perpetual (Pro), users can trade a variety of cryptocurrencies on BNB Chain, Ethereum, Solana, and Arbitrum, all with very competitive exchange fees (0.01% maker fee, 0.035% taker fee), and with the most control possible. Several trading options are available beyond just market and limit orders, such as hidden orders to protect a trader's intended price point. More advanced trading options achieve a professional-grade experience enabling automation, grid trading, multiple forms of collateral, and even the ability to purchase tokenized futures of U.S stocks such as AAPL/USDT.

1001x (Simple) is a streamlined approach to fully on-chain trading. Users can still engage in perpetual contracts with high leverage options. It works like a pooled automated market maker where traders open leveraged long or short positions against a liquidity pool called the ALP. Prices are set using oracle feeds from primarily Pyth, and verified with Chainlink. Since there is no order book, the system uses fees, funding, and slippage formulas to compensate liquidity providers, protect the pool from imbalanced positions, and keep prices close to fair market value. Fees for normal leverage are 0.08% for opening and closing fees. Dynamic fees are charged for positions with higher leverage. An additional small flat fee is charged for execution.

Beyond perpetuals trading Aster also offers spot trading and several yield-generating products geared towards a more traditional trading experience.

General Auditing Background

Figure 6: Auditors

Salus Security

PeckShield

Halborn

Audits for Aster reviewed by Salus Security, PeckShield, and HALBORN reviewed the following protocol components between December 17, 2024- September 13, 2025.

1. Aster Vault
2. Aster Earn
3. asBNB
4. USDF
5. asUSDF
6. asCAKE

The audits reviewed a total of 31 issues that were between informational and high-risk issues. The majority were informational issues, meaning they do not pose immediate risk but are relevant to address in accordance with best practices for security and protocol defense. There was only 1 high risk issue, regarding users' private information, specifically the degree of security for users security keys. This was a major issue that was addressed, resolved, and reported on by Salus Security in early 2025, but has since not been an issue. Like the high-severity security risk, 29/31 issues were resolved 100%, the remaining open 2 are in progress of being addressed as of October 9, 2025.

All audits functioned to support protocol operations for Aster. In terms of smart contracts and DeFI, these audits ensured

1. Code Correctness and Vulnerability Detection
2. Access Control and Permission Checks
3. Business Logic and Edge-Case Behaviors
4. Gas Optimization and Performance
5. Formal Verifications
6. Architecture Reviews and Threat Modeling
7. Reporting and Remediation Suggestions

Together the audits were expected to add credibility to the protocol, a factor that can be questioned after Aster was delisted from DeFi Llama for suspected wash trading which leaves to question the validity of the audits. This dilemma complicates the degree of validity each audit has offered since the third-parties missed this despite their legitimate image in the eyes of the community. It calls to question if there are more issues with the protocol that have been muddles by gaps, scope mismatches, the depth of audit, effectiveness of post-audit changes, multi-party findings inconsistencies, and validity that may stem from to many auditors in play.

Protocol Versus Competitors

Feature	Aster	Hyperliquid	dYdX
Trading Model	Hybrid (Order Book + AMM-like)	On-chain Order Book	Off-chain order book synchronized by validators
Collateral Type	Yield-Bearing + Standard stablecoins (asBNB, USDF)	Primarily USDC	USDC
Multi-Chain Support	Yes (4+ chains)	No (Own L1)	No (Own app-chain)
Stock Perpetuals	Yes	No	No
Privacy Feature	Hidden Orders	No hidden trades	No hidden trades

*Chart adapted from Coingecko

Compared against other decentralized exchanges, Aster offers a robust trading interface with unique features not available by most other exchanges such as hidden orders, stock perpetuals, and yield generating products. Furthermore, Aster's backing and association with YZi Labs / the Binance ecosystems promotes trust and has encouraged liquidity inflows vital to the health of the exchange.

The success of Aster largely depends on market sentiment, and which exchanges traders choose where to operate from. Airdrops and high-profile backings have raised attention to Aster, now the company must retain it's user base.

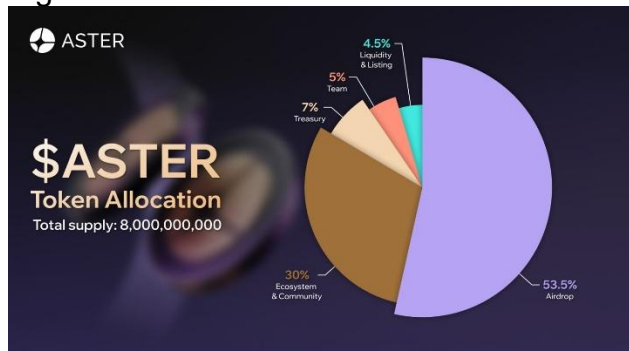

How Token Extracts Value

\$ASTER serves as the core token for the Aster protocol, designed as a governance and utility token. Holders can participate in voting on proposals for the protocol, which could affect exchange fees, leverage limits, or the introduction of new features or markets. As Aster grows, its users will be able to shape how the product evolves. The network encourages the use of \$ASTER by placing a 5% discount on fees paid with the token, and has further supported the token through buybacks (as recently at Oct. 10 2025).

Tokenomics/Vesting Schedule

Figure 7: Token Distribution

The token allocation primarily focuses over half of the total token allocation on airdrops, the key to Aster's roadmap. 53.5%, or 4,280,000,000 \$ASTER, where 8.8% of the total allocation will be unlocked immediately for the eligible airdrop participants that earned Eh or Au points from stage 0 points program. This initial, yet smaller airdrop will act as immediate on-boarding incentive that is designed to reward early adopters and attract potential new community members.

Second, to the large distribution for airdrops, the ecosystem and community, at 30%, is designed to be vested over 20 months. The vesting schedule is designed to be a linearly distributed model across a 20-month period. Although it is distributed faster than other projects, it is designed to rapidly expand and establish the ecosystem while promoting a seamless transition from \$APX to \$ASTER.

The remaining tokenomics and vesting decisions come together to support future strategic growth initiatives in the long-term. This leaves remaining tokens to continue successfully align the product, long-term supporters, and protocol sustainability.

Modeling/Ratio Analysis

Aster's performance has been a topic of controversy. There has been much debate on the credibility of the protocol's API, whose numbers had been erroneously positive going into October 2025. A CoinMarketCap infographic clearly shows Aster's dominance in trading volume and fees generated.

CoinMarketCap

Top 10 Perp DEXes Volume, Fee, OI Comparison

Protocol	24h Volume	Open Interest	24h Fees
Aster	\$41.78B	\$4.86B	\$13.44M
Lighter	\$10.13B	\$2.08B	N/A
Hyperliquid	\$9.02B	\$14.68B	\$3.29M
edgeX	\$4.58B	\$1.32B	\$1.74M
ApeX Protocol	\$1.31B	\$94.88M	\$0.25M
Paradex	\$1.19B	\$545.38M	\$0.07M
Pacifica	\$1.18B	\$379.78M	N/A
GRVT	\$733.38M	N/A	N/A
Jupiter	\$553.56M	\$936.40M	\$2.39M
Reya DEX	\$552.27M	\$16.57M	N/A

*Data As of Oct 6 2025

The glowing reports were reflected by various reputable sources including the likes of DefiLlama and Artemis, until many in the community noticed odd correlations. This led to a delisting on DefiLlama and many proposing wash trading as the reason. Later backed up in a Cointelegraph article published on October 6, 2025, the news was a direct hit to the credibility of Aster. A week later Aster has fallen from above \$2.00 to now hoping to hold a \$1.50 support.

According to the metrics from the Aster API, where “the team is currently looking into discrepancies in recent volume data,” active transacting user has dropped from a high of ~33.8K to around 5.9K. Correlating well with the buzz surround airdrops, disregarding potential data discrepancies, Aster seems to have created a community focused early adoption.

High-profile affiliations with the likes of CZ, Binance, and Mr. Beast, doubled with airdrops seems to have spurred activity on a fledgling exchange. At a time of intense competition in a rapidly developing space withing blockchain, it is no surprise a new company is going to rush to get new users to carve out market share. With Hyperliquid being an early front runner, the new question is which exchanges are going to compete.

Protocol	DEX / CEX	24hr Volume	24hr Open Interest
Aster (Futures)	DEX	\$16,901,367,191	\$1,778,326,576
Hyperliquid (Futures)	DEX	\$11,411,234,921	\$7,808,306,886
Uniswap (Ethereum)	DEX	\$1,315,169,116	n/a
Binance	CEX	\$41,711,120,486	n/a
Coinbase Exchange	CEX	\$4,289,972,782	n/a

Investment Thesis

Aster is a tricky investment thesis to craft as the reasons to buy stem from the perpetual DEX market rather than the project itself. If anything, the project contains more of the red flags than the sector as it has thus far provided questionable metrics and allegations of wash trading just in their first month. The perpetual DEX demand is worth billions therefore by adding multiple into our portfolio, Aster, and Hyperliquid to name a few, the portfolio stands to be better balanced, especially as Hyperliquid and Aster do not directly correlate with one another. Although not inverse from one another, they do not rise and fall at the same percentages and having both makes our portfolio stronger.

Moreover, with airdrops playing such a large role in their roadmap, the upcoming airdrops will stand to benefit the portfolio, token, and ecosystem. With airdrops onboarding more users, the ecosystem's transaction volume increases, fees collected will likely increase, and in turn, so will the overall value of the token. Although the Oregon Blockchain Group will not be able to claim any airdropped rewards from lack of participation, the increased volume that brings Aster to the forefront of perpetual DEXs makes participation before the airdrops appealing.

Additionally, much of the crypto activity is connected through the dominance/failure of Bitcoin. As such, the decline of Bitcoin may upstart a decline of the perpetual DEX market or become the fuel to the fire behind futures trading on chain. There are many questions that may hinder the success of Aster, however, if the benefits of the airdrops, market sentiment, and futures trading can maintain the current standard, Aster is a viable token for a 5x return.

Fund Recommendation

Buy 3 \$ETH worth of \$ASTER.

The fund recommendation takes into consideration that this purchase is a high risk buy. Under such premises, this is not expected to be held longer than a few months where the token is expected to hold around \$1.50 USD. If it goes down, the token will rapidly decline towards \$0.00. However, if post-airdrop and Bitcoin breakout and \$ASTER can rise above and hit above \$2.00, we believe that this investment will be a black and white position where we can either sink or swim. If \$ASTER and if it can hold beyond these conditions, the token will hit the moon and our point of entry remains strong if it is at or below \$1.50 where the token holds. At any point where the token drops below \$1.00 USD, we recommend the fund sell as it will then continue its downward trend rather than push through like \$HYPE did in April 2025 after its own all time low.

In summary, the fund recommendation is to:

1. Hold as long as \$ASTER remains at or around \$1.50.
2. Sell if \$ASTER drops at or below \$1.00 USD.

Disclaimer

The above material and content is educational in nature and should not be considered to be a recommendation to invest.
